WO 2004/087153 A2

## USE OF SMALL MOLECULE COMPOUNDS FOR IMMUNOPOTENTIATION

### FIELD OF THE INVENTION

[0001] This invention relates generally to compounds capable of stimulating or modulating an immune response in a subject. More particularly the invention pertains to novel combinations of antigens with small molecules to be used in vaccine therapies. The compounds in one embodiment can be used as adjuvants for prophylactic and therapeutic vaccines for infectious diseases and cancer. In another embodiment they can be used as immunotherapeutics for cancer, infectious diseases and/or allergy/asthma either alone or in combination with existing therapies.

### BACKGROUND OF THE INVENTION

[0002] Immune response to certain antigens that are otherwise weakly antigenic can be enhanced through the use of vaccine adjuvants. Such adjuvants potentiate the immune response to specific antigens and are therefore the subject of considerable interest and study within the medical community.

[0003] Research has permitted development of vaccines possessing antigenic epitopes that were previously impossible to produce. For example, currently available vaccine candidates include synthetic peptides mimicking streptococcal, gonococcal, and malarial antigens. These purified antigens are generally weak antigens, however, that require adjuvants in order to evoke protective immunity. However, conventional vaccine adjuvants possess a number of drawbacks that limit their overall use and effectiveness.

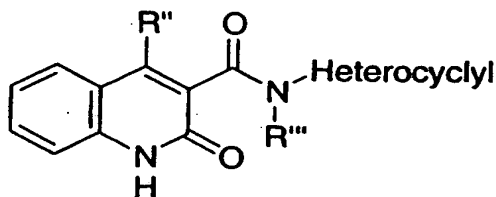

Again, this is fine for vaccines but not other uses.

[0004] Substances that stimulate immune cells *in vitro* exhibit similar immunostimulatory effects *in vivo*. These compounds, such as recombinant cytokines, pathogen products (e.g. toxins, lipids, proteins/peptides, carbohydrates and nucleic acids) and other mammalian-derived immunostimulatory molecules (e.g. heat shock proteins, complement, immune complexes and proteoglycans) all induce a measurable pro-inflammatory response both *in vitro* and *in vivo*.

[0005] Historically, the classic adjuvants have been Freund's complete or incomplete (i.e., without mycobacteria) adjuvants. Edmund Coley described the potential of Coley's toxin for cancer immuno-therapy. Other materials, such as mineral oil and aluminum hydroxide, have also been used as adjuvants, but they invariably suffer from disadvantages. For example, mineral oil is known to produce tissue irritation and to be potentially oncogenic. Alum, the only approved adjuvant in the United States, also induces granulomas at the inoculation site and furthermore it does not effectively induce cell-mediated immunity. Moreover, many of the adjuvants currently available have limited utility because they contain components, that are not metabolizable in humans. Additionally, most adjuvants are difficult to prepare in that they may require time consuming procedures and the use, in some cases, of elaborate and expensive equipment to formulate a vaccine and adjuvant system.

[0006] Immunological adjuvants are described in "Current Status of Immunological Adjuvants", Ann. Rev. Immunol., 1986, 4, pp. 369-388, and "Recent Advances in Vaccine Adjuvants and Delivery Systems" by Derek T O'Hagan and Nicholas M. Valiente. See also U.S. Pat. Nos. 4,806,352; 5,026,543; and 5,026,546 for disclosures of various vaccine adjuvants appearing in the patent literature.

[0007] Compounds are described in issued U.S. Patent Nos. 4,547,511 and 4,738,971 with the general structure (a):

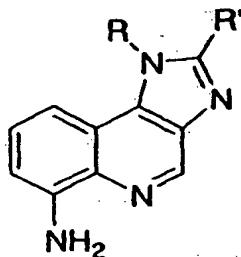

a

for the treatment of disorders responsive to agents that enhance cell-mediated immunity. An essential component of the molecule as described in the cited patents is the amide substituent as shown in structure (a). The invention did not contemplate combinations with antigens.

[0008] Immunostimulatory oligonucleotides and polynucleotides are described in PCT WO 98/55495 and PCT WO 98/16247. U.S. Patent Application No. 2002/0164341 describes adjuvants including an unmethylated CpG dinucleotide (CpG ODN) and a non-nucleic acid adjuvant. U.S. Patent Application No.

2002/0197269 describes compositions comprising an antigen, an antigenic CpG-ODN and a polycationic polymer.

[0009] Additionally, issued U.S. Patent Nos. 4,689,338, 5,389,640, 5,268,376, 4,929,624, 5,266,575, 5,352,784, 5,494,916, 5,482,936, 5,346,905, 5,395,937, 5,238,944, 5,525,612, WO99/29693 and U.S. Ser. No. 09/361,544 disclose compounds of the general structure (b):

for the use as "immune response modifiers."

[0010] There has been an effort to find new immune modulators for use as adjuvants for vaccines and immunotherapies that would overcome the drawbacks and deficiencies of conventional immune modulators. In particular, an adjuvant formulation that elicits potent cell-mediated and humoral immune responses to a wide range of antigens in humans and domestic animals, but lacking the side effects of conventional adjuvants and other immune modulators, would be highly desirable. This need could be met by small molecule immune potentiators (SMIPs) because the small molecule platform provides diverse compounds for the selective manipulation of the immune response, necessary for increasing the therapeutic index immune modulators.

[0011] Furthermore, it would be desirable to provide novel compounds with a varied capacity to alter levels and/or profiles of cytokine production in human immune cells. Compounds with structural disparities will often times elicit a desired response through a different mechanism of action, or with greater specificity to a target, such as a dendritic cell, modulating potency and lowering side effects when administered to a patient.

[0012] The immunosuppressive effect of cytostatic substances has rendered them useful in the therapy of autoimmune diseases such as multiple sclerosis, psoriasis and certain rheumatic diseases. Even here their beneficial effect has to be weighed

against the serious side effects that necessitate too low dosages and/or interruption of the treatment.

**[0013]** It is the object of the present invention to provide a combination of active substances that results in a significantly improved cytostatic or cytotoxic effect as compared to conventional cytostatics given alone, e.g. vincristin, methotrexate, cisplatin etc. Thereby, chemotherapies may be offered that combine increasing efficiency with a large reduction of side effects and therapeutic doses. Thus, the therapeutic efficiency of known cytostatic drugs is increased. Also, certain cell lines that are insensitive to chemotherapeutic treatment may become susceptible to chemotherapy by applying the combination of active substances.

**[0014]** Therapeutics that could serve to augment natural host defenses against viral and bacterial infections, or against tumor induction and progression, with reduced cytotoxicity would be very beneficial. The present invention provides such therapeutic agents, and further provides other related advantages.

**[0015]** All of the aforementioned documents are incorporated by reference as if fully set forth herein.

### **SUMMARY OF THE INVENTION**

**[0016]** The instant invention provides novel immune potentiators, immunogenic compositions, novel compounds and pharmaceutical compositions, and novel methods of administering a vaccine, by administering small molecule immune potentiators in combination with antigens. The invention further provides compositions, novel compounds and pharmaceutical compositions, for use in the treatment of cancer, infectious diseases, allergies, and asthma.

**[0017]** The SMIP compounds used in the methods and compositions of the invention are inexpensive to produce and easy to administer. They have potential for finer specificity compared to existing immunostimulants, thus providing improved efficacy and safety profiles.

**[0018]** As adjuvants, the SMIP compounds are combined with numerous antigens and delivery systems to form a final vaccine product.

**[0019]** As immuno-therapeutics, the SMIP compounds are used alone or in combination with other therapies (e.g. anti-virals, anti-bacterials, other immune modulators or in therapeutic vaccine antigens) for treatment of chronic infections

such as HIV, HCV, HBV, HSV, and *H. pylori*, as well as medicaments for the reduction of tumor growth.

**[0020]** As immunotherapeutics, the SMIP compounds also may be used for the treatment of cancer either alone or in combination with other anti-cancer therapies (e.g. chemotherapeutic agents, mAbs or other immune potentiators). In addition, certain SMIPs with the capacity to induce Type 1 cytokines (e.g. IL-12, TNF or IFN's) could be useful for the treatment of allergies or asthma due to their capacity to steer the immune response towards more benign sequelae. The SMIP compounds may be used for example for the treatment of BCG, cholera, plague, typhoid, hepatitis B infection, influenza, inactivated polio, rabies, measles, mumps, rubella, oral polio, yellow fever, tetanus, diphtheria, hemophilus influenzae b, meningococcus infection, and pneumococcus infection. The SMIP compounds may be used in an anti cell proliferative effective amount for the treatment of cancer. The SMIP compounds may also be used in anti-Th2/Type2 cytokine amount for the deviation of allergic/asthmatic immune responses.

**[0021]** In another embodiment methods of treating cancer are provided wherein known anticancer agents are combined with SMIP compounds to reduce tumor growth in a subject. A number of suitable anticancer agents are contemplated for use in the methods of the present invention and are described more thoroughly in the detailed description.

**[0022]** In accordance with the present invention, there is provided a method of inhibiting tumor cell growth in a subject, which method comprises administering to said subject an effective dose of a combination containing at least a SMIP and a MAb, wherein said combination is more effective to inhibit such cell growth than when said MAb is administered individually. Further provided are methods of treating cancer with said combination comprising an additional SMIP compound or MAb, as well as methods of administration to a subject in need thereof.

**[0023]** Applicants have discovered a broad class of compounds that unexpectedly shows potent stimulation of cytokine activity in human peripheral blood mononuclear cells and as immunotherapeutics and/or vaccine adjuvants in combination with an antigen(s), will provide effective treatments for disorders described herein and those apparent to one skilled in the art.

The antigen is associated, for example, with a disease such as BCG, cholera, plague, typhoid, hepatitis B infection, influenza, inactivated polio, rabies, measles, mumps, rubella, oral polio, yellow fever, tetanus, diphtheria, hemophilus influenzae b, meningococcus infection, and pneumococcus infection. - [0084] The methods of the invention are useful in treating "allergic diseases," that is accomplished in the same way as other immunotherapeutic methods described herein.
- [0085] An "allergen" refers to a substance (antigen) that can induce an allergic or asthmatic response in a susceptible subject. The list of allergens is enormous and can include pollens, insect venoms, animal dander, dust, fungal spores, and drugs (e.g. penicillin).
- [0086] "Asthma" refers to a disorder of the respiratory system characterized by inflammation, narrowing of the airways and increased reactivity of the airways to inhaled agents. Asthma is frequently, although not exclusively associated with atopic or allergic symptoms.
- [0087] The term "leukotriene inhibitor" includes any agent or compound that inhibits, restrains, retards or otherwise interacts with the action or activity of leukotrienes, such as, but not limited to, 5-lipoxygenase ("5-LO") inhibitors, 5-lipoxygenase activating protein ("FLAP") antagonists, and leukotriene D4 ("LTD4 ") antagonists.
- [0088] "Immune-stimulation" or "immune potentiation" refers to activation of the immune system, including humoral or cellular activation, for example, activation of a cell, such as a killer (T or NK) or dendritic cell of the immune system, for example, causing the increase in cytokine production from a dendritic cell leading to an overall enhancement of host defense (immune response).
- [0089] An "immunogenic composition" refers to a composition capable of modulating the production of cytokines in a subject thereby effecting immune potentiation in the subject.
- [0090] An "immune-stimulatory effective amount" is an amount effective for activation of the immune system, for example, causing the increase in cytokine production from a dendritic cell leading to an overall enhancement of host defense (immune response).
- [0091] "Enhancing the immune response to an antigen" by a compound refers to enhancement of the immune response in comparison to that in the absence of the compound. An enhanced immune-response eliciting composition is a composition generally comprising an antigen and a small molecule immune potentiator compound that elicits an immune response greater than a composition comprising

an antigen and not containing one or more small molecule immune potentiator compounds. In this embodiment, the compound acts as an adjuvant, for example for use in vaccine compositions and methods.

[0092] The term "effective amount" is an amount necessary or sufficient to realize a desired biological effect. For example, an effective amount of a compound to treat an infectious disorder may be an amount necessary to cause an antigen specific immune response upon exposure to an infectious agent. The effective amount may vary, depending, for example, upon the condition treated, weight of the subject and severity of the disease. One of skill in the art can readily determine the effective amount empirically without undue experimentation.

[0093] As used herein "an effective amount for treatment" refers to an amount sufficient to palliate, ameliorate, stabilize, reverse, slow or delay progression of a condition such as a disease state.

[0094] A "subject" or "patient" is meant to describe a human or vertebrate animal including a dog, cat, pocket pet, marmoset, horse, cow, pig, sheep, goat, elephant, giraffe, chicken, lion, monkey, owl, rat, squirrel, slender loris, and mouse.

[0095] A "pocket pet" refers to a group of vertebrate animals capable of fitting into a coat pocket such as, for example, hamsters, chinchillas, ferrets, rats, guinea pigs, gerbils, rabbits and sugar gliders.

[0096] As used herein, the term "pharmaceutically acceptable ester" refers to esters, that hydrolyze *in vivo* and include those that break down readily in the human body to leave the parent compound or a salt thereof. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanolic, alkenolic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Representative examples of particular esters include, but are not limited to, formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

[0097] The term "pharmaceutically acceptable prodrugs" refers to those prodrugs of the compounds of the present invention that are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals with undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the

invention. The term "prodrug" refers to compounds that are rapidly transformed *in vivo* to yield the parent compound of the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated by reference. Prodrugs as described in U.S. Patent No. 6,284,772 for example may be used.

**[0098]** The term "loweralkyl" refers to branched or straight chain acyclical alkyl groups comprising one to ten carbon atoms, including, e.g., methyl, ethyl, propyl, isopropyl, n-butyl, t-butyl, neopentyl and the like.

**[0099]** The phrase "alkyl" refers to alkyl groups that do not contain heteroatoms. Thus the phrase includes straight chain alkyl groups such as methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, undecyl, dodecyl and the like. The phrase also includes branched chain isomers of straight chain alkyl groups, including but not limited to, the following that are provided by way of example: —  $\text{CH}(\text{CH}_3)_2$ ,  $-\text{CH}(\text{CH}_3)(\text{CH}_2\text{CH}_3)$ ,  $-\text{CH}(\text{CH}_2\text{CH}_3)_2$ ,  $-\text{C}(\text{CH}_3)_3$ ,  $-\text{C}(\text{CH}_2\text{CH}_3)_3$ ,  $-\text{CH}_2\text{CH}(\text{CH}_3)_2$ ,  $-\text{CH}_2\text{CH}(\text{CH}_3)(\text{CH}_2\text{CH}_3)$ ,  $-\text{CH}_2\text{CH}(\text{CH}_2\text{CH}_3)_2$ ,  $-\text{CH}_2\text{C}(\text{CH}_3)_3$ ,  $-\text{CH}_2\text{C}(\text{CH}_2\text{CH}_3)_3$ ,  $-\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)(\text{CH}_2\text{CH}_3)$ ,  $-\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_3)_2$ ,  $-\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_3)(\text{CH}_2\text{CH}_3)$ ,  $-\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_2\text{CH}_3)_2$ ,  $-\text{CH}_2\text{CH}_2\text{C}(\text{CH}_3)_3$ ,  $-\text{CH}_2\text{CH}_2\text{C}(\text{CH}_2\text{CH}_3)_3$ ,  $-\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$ ,  $-\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)_2$ ,  $-\text{CH}(\text{CH}_2\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)(\text{CH}_2\text{CH}_3)$ , and others. The phrase also includes cyclic alkyl groups such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl and such rings substituted with straight and branched chain alkyl groups as defined above. The phrase also includes polycyclic alkyl groups such as, but not limited to, adamantyl norbornyl, and bicyclo[2.2.2]octyl and such rings substituted with straight and branched chain alkyl groups as defined above. Thus, the phrase unsubstituted alkyl groups includes primary alkyl groups, secondary alkyl groups, and tertiary alkyl groups. Unsubstituted alkyl groups may be bonded to one or more carbon atom(s), oxygen atom(s), nitrogen atom(s), and/or sulfur atom(s) in the parent compound. Preferred unsubstituted alkyl groups include straight and branched chain alkyl groups and cyclic alkyl groups having 1 to 20 carbon atoms. More preferred such unsubstituted alkyl groups have from 1 to 10 carbon atoms while even more preferred such groups

have from 1 to 5 carbon atoms. Most preferred unsubstituted alkyl groups include straight and branched chain alkyl groups having from 1 to 3 carbon atoms and include methyl, ethyl, propyl, and  $-\text{CH}(\text{CH}_3)_2$ .

**[00100]** The phrase "substituted alkyl" refers to an unsubstituted alkyl group as defined above in which one or more bonds to a carbon(s) or hydrogen(s) are replaced by a bond to non-hydrogen and non-carbon atoms such as, but not limited to, a halogen atom in halides such as F, Cl, Br, and I; a phosphorus atom in groups such as phosphate and dialkyl alkylphosphonate; oxygen atom in groups such as hydroxyl groups, alkoxy groups, aryloxy groups, and ester groups; a sulfur atom in groups such as thiol groups, alkyl and aryl sulfide groups, sulfone groups, sulfonyl groups, and sulfoxide groups; a nitrogen atom in groups such as amines, amides, alkylamines, dialkylamines, arylamines, alkylarylamines, diarylamines, N-oxides, imides, and enamines; a silicon atom in groups such as in trialkylsilyl groups, dialkylarylsilyl groups, alkyl diarylsilyl groups, and triarylsilyl groups; and other heteroatoms in various other groups. Substituted alkyl groups also include groups in which one or more bonds to a carbon(s) or hydrogen(s) atom is replaced by a bond to a heteroatom such as oxygen in carbonyl, carboxyl, and ester groups; nitrogen in groups such as imines, oximes, hydrazones, and nitriles. Preferred substituted alkyl groups include, among others, alkyl groups in which one or more bonds to a carbon or hydrogen atom is/are replaced by one or more bonds to fluorine atoms. One example of a substituted alkyl group is the trifluoromethyl group and other alkyl groups that contain the trifluoromethyl group. Other alkyl groups include those in which one or more bonds to a carbon or hydrogen atom is replaced by a bond to an oxygen atom such that the substituted alkyl group contains a hydroxyl, alkoxy, aryloxy group, or heterocycloxy group. Still other alkyl groups include alkyl groups that have an amine, alkylamine, dialkylamine, arylamine, (alkyl)(aryl)amine, diarylamine, heterocyclylamine, (alkyl)(heterocyclyl)amine, (aryl)(heterocyclyl)amine, or diheterocyclylamine group.

**[00101]** The term "alkoxy" refers to  $\text{RO}-$  wherein R, for example, is alkyl such as loweralkyl defined above. Representative examples of loweralkyl alkoxy groups include methoxy, ethoxy, t-butoxy and the like.

**[00102]** The term "substituted alkoxy" refers to  $\text{RO}-$ , where R is, for example, an alkyl substituted, for example, with a halogen. RO is for example  $\text{OCF}_3$ .

- [00103]** The term "alkenyl" refers to a branched or straight chain groups comprising two to twenty carbon atoms which also comprises one or more carbon-carbon double bonds. Representative alkenyl groups include prenyl, 2-propenyl (i.e., allyl), 3-methyl-2-butenyl, 3,7-dimethyl-2,6-octadienyl, 4,8-dimethyl-3,7-nonadienyl, 3,7,11-trimethyl-2,6,10-dodecatrienyl and the like.
- [00104]** The term "substituted alkenyl" refers to alkenyl groups that are substituted, for example, diethyl hex-5-enylphosphonate, and others with an alkyl or substituted alkyl group such as dialkyl phosphate or an ester such as an acetate ester.
- [00105]** The term "dialkyl amino" refers to an amino group substituted with two alkyl groups such as C1-20 alkyl groups.
- [00106]** The term "substituted dialkyl amino" refers to a dialkylamino substituted, for example, with a carboxylic acid, ester, hydroxy or alkoxy.
- [00107]** The term "hydroxyalkylthio" refers to a thio radical to which is appended a hydroxyalkyl group, where the alkyl is for example lower alkyl. An example is hydroxyethylthio,  $-\text{SCH}_2\text{CH}_2\text{OH}$ .
- [00108]** The term "N-alkylsulfonamide" refers to the group  $-\text{SO}_2\text{NHalkyl}$ , where alkyl is, for example, octyl.

- [00110]** The phrase "aryl" refers to aryl groups that do not contain heteroatoms. Thus the phrase includes, but is not limited to, groups such as phenyl, biphenyl, anthracenyl, naphthenyl by way of example. Although the phrase "unsubstituted aryl" includes groups containing condensed rings such as naphthalene, it does not include aryl groups that have other groups such as alkyl or halo groups bonded to one of the ring members, as aryl groups such as tolyl are considered herein to be substituted aryl groups as described below. A preferred unsubstituted aryl group is phenyl. Unsubstituted aryl groups may be bonded to one or more carbon atom(s), oxygen atom(s), nitrogen atom(s), and/or sulfur atom(s) in the parent compound, however.
- [00111]** The phrase "substituted aryl group" has the same meaning with respect to aryl groups that substituted alkyl groups had with respect to alkyl groups.

However, a substituted aryl group also includes aryl groups in which one of the aromatic carbons is bonded to one of the non-carbon or non-hydrogen atoms described above and also includes aryl groups in which one or more aromatic carbons of the aryl group is bonded to a substituted and/or unsubstituted alkyl, alkenyl, or alkynyl group as defined herein. This includes bonding arrangements in which two carbon atoms of an aryl group are bonded to two atoms of an alkyl, alkenyl, or alkynyl group to define a fused ring system (e.g. dihydronaphthyl or tetrahydronaphthyl). Thus, the phrase "substituted aryl" includes, but is not limited to tolyl, and hydroxyphenyl among others.

- [00164] In another embodiment the SMIP compounds have antiviral activity. In another embodiment the SMIP compounds have antimicrobial activity.
- [00165] SMIP compounds identified by *in-vitro* (cellular or non-cellular assays) or *in-vivo* methods are thoroughly described in Methods 1 and 2.
- [00166] The subject invention also includes isotopically-labeled SMIP compounds, that are structurally identical to those disclosed above, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, sulfur, fluorine and chlorine, such as  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{15}\text{N}$ ,  $^{18}\text{O}$ ,  $^{17}\text{O}$ ,  $^{31}\text{P}$ ,  $^{32}\text{P}$ ,  $^{35}\text{S}$ ,  $^{18}\text{F}$  and  $^{36}\text{Cl}$ , respectively. Compounds of the present invention, prodrugs thereof, and pharmaceutically acceptable salts of said compounds and of said prodrugs that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically labeled compounds of the present invention, for example those into which radioactive isotopes such as  $^3\text{H}$  and  $^{14}\text{C}$  are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e.,  $^3\text{H}$ , and carbon-14, i.e.,  $^{14}\text{C}$ , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e.,  $^2\text{H}$ , may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labeled compounds of this invention and prodrugs thereof can generally be prepared by carrying out known or referenced procedures and by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent.

**[00196]** It should be understood that the organic compounds described herein may exhibit the phenomenon of tautomerism. It should be understood that the invention encompasses any tautomeric form of the drawn structure. The compounds comprise asymmetrically substituted carbon atoms. Such

asymmetrically substituted carbon atoms can result in the compounds comprising mixtures of stereoisomers at a particular asymmetrically substituted carbon atom or a single stereoisomer. As a result, racemic mixtures, mixtures of diastereomers, as well as single diastereomers of the compounds are included in the present invention. The terms "S" and "R" configuration,, are as defined by the *IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem.* (1976) 45, 13-30. The terms  $\alpha$  and  $\beta$  are employed for ring positions of cyclic compounds. The  $\alpha$ -side of the reference plane is that side on which the preferred substituent lies at the lowered numbered position. Those substituents lying on the opposite side of the reference plane are assigned  $\beta$  descriptor. It should be noted that this usage differs from that for cyclic stereoparents, in which " $\alpha$ " means "below the plane" and denotes absolute configuration. The terms  $\alpha$  and  $\beta$  configuration,, are as defined by the *Chemical Abstracts Index Guide-Appendix IV* (1987) paragraph 203.

**[00209]** In another embodiment methods of manufacturing compounds and compositions described herein are provided and contemplated to fall within the scope of the invention.

**[00210]** Qualitative and quantitative measurement of the immune response of a compound or composition can be implemented using methods known in the art, such as measuring antigen specific antibody production, activation of specific populations of lymphocytes such as CD4<sup>+</sup>, CD8<sup>+</sup> T cells or NK cells, and/or production of cytokines such as IFN, IL-2, IL-4 or IL-12. Methods for measuring specific antibody responses include enzyme-linked immunosorbent assay (ELISA) as known in the art. Cytotoxicity assays can be performed, e.g., as described in Raz et al., (1994) Proc. Natl. Acad. Sci. USA 91:9519-9523. Serum concentrations of cytokines can be measured, for example, by ELISA. Such

assays are described, e.g., in *Selected Methods in Cellular Immunology* (1980) Mishell and Shiigi, eds., W.H. Freeman and Co.

**[00211]** In one embodiment, a compound or composition, such as a SMIP compound, is considered effective to elicit an immune response if a concentration of 20  $\mu$ M (or alternatively 100  $\mu$ M, or 200 $\mu$ M, or 300 $\mu$ M) of the SMIP compound causes the production of TNF- $\alpha$  in an in vitro cell based assay of human peripheral blood mononuclear cells, wherein the concentration of the human peripheral blood mononuclear cells is about 500,000/mL, and wherein the cells are exposed to the compound for about 18-24 hours, e.g., about 24 hours.

**[00212]** The above method of stimulating a local immune response for example in selected cells or tissues of a patient includes the stimulation of a local immune response wherein the selected cells or tissues are infected or cancerous. In one embodiment the selected cells or tissues are infected with a fungus or bacterium. In another embodiment the selected tissues are inflamed with an allergen, for example in an asthmatic condition. In another embodiment the selected cells are infected with a virus or bacteria. In one particular embodiment, Alum (especially aluminium phosphate and/or hydroxide) and MF59 are preferred for use with saccharide antigens.

**[0101]** The invention is also directed to administering the immunogenic composition. The vaccine is administered in an amount effective to stimulate an immune response. The amount that constitutes an effective amount depends, *inter alia*, on the particular vaccine used, the particular adjuvant compound being

administered and the amount thereof, the immune response that is to be enhanced (humoral or cell mediated), the state of the immune system (e.g., suppressed, compromised, stimulated), and the desired therapeutic result. Accordingly it is not practical to set forth generally the amount that constitutes an effective amount of the vaccine. Those of ordinary skill in the art, however, can readily determine the appropriate amount with due consideration of such factors.

**[0102]** The immunogenic compositions of the invention can be administered to animals, e.g., mammals human and non-human, including, for example, pocket pets, fowl, and the like according to conventional methods well known to those skilled in the art (e.g., orally, subcutaneously, nasally, topically).

**[0103]** Suitable vaccines include, but are not limited to, any material that raises either humoral or cell mediated immune response, or both. Suitable vaccines include live viral and bacterial antigens and inactivated viral, tumor-derived, protozoal, organism-derived, fungal, and bacterial antigens, toxoids, toxins, polysaccharides, proteins, glycoproteins, peptides, and the like. Conventional vaccines, such as those used in connection with BCG (live bacteria), cholera, plague, and typhoid (killed bacteria), hepatitis B, influenza, inactivated polio, and rabies (inactivated virus), measles, mumps, rubella, oral polio, and yellow fever (live virus), tetanus and diphtheria (toxoids), hemophilus influenzae b, meningococcal, and pneumococcal (bacterial polysaccharides) also can be used. Any antigen known in the art or disclosed herein may be used.

**[0104]** Furthermore, it is contemplated that certain currently experimental vaccines, especially materials such as recombinant proteins, glycoproteins, and peptides that do not raise a strong immune response, will also find use in connection with the SMIP compound. Exemplary experimental subunit antigens include those related to viral disease such as adenovirus, AIDS, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, hepatitis A, hepatitis B, hepatitis C, HSV-1, HSV-2, hog cholera, influenza A, influenza B, Japanese encephalitis, measles, parainfluenza, rabies, respiratory syncytial virus, rotavirus, wart, and yellow fever.

**[0107]** The composition may comprise one or more of the above antigens.

**[0108]** Where a saccharide or carbohydrate antigen is used, it is preferably conjugated to a carrier protein in order to enhance antigenicity (47-56). Preferred carrier proteins are bacterial toxins or toxoids, such as diphtheria or tetanus toxoids. The CRM<sub>197</sub> diphtheria toxoid is particularly preferred. Other suitable carrier proteins include the *N. meningitides* outer membrane protein (57), synthetic peptides (58, 59), heat shock proteins (60), pertussis proteins (61, 62), protein D from *H. influenzae* (63), toxin A or B from *C. difficile* (64) etc. Where a mixture comprises capsular saccharides from both serogroups A and C, it is preferred that the ratio (w/w) of MenA saccharide:MenC saccharide is greater than 1 (e.g. 2:1, 3:1, 4:4, 5:1, 10:1 or

higher). Saccharides from different serogroups of *N. meningitidis* may be conjugated to the same or different carrier proteins.

[0109] Any suitable conjugation reaction can be used, with any suitable linker where necessary. [0110] The pharmaceutical compositions containing the SMIP compounds described herein can include additives such as excipients. Suitable pharmaceutically acceptable excipients include processing agents and drug delivery modifiers and enhancers, such as, for example, calcium phosphate, magnesium stearate, talc, monosaccharides, disaccharides, starch, gelatin, cellulose, methyl cellulose, sodium carboxymethyl cellulose, dextrose, hydroxypropyl- $\beta$ -cyclodextrin, polyvinylpyrrolidone, low melting waxes, ion exchange resins, and the like, as well as combinations of any two or more thereof. Other suitable pharmaceutically acceptable excipients are described in "Remington's Pharmaceutical Sciences," Mack Pub. Co., New Jersey (1991) or "Remington: The Science and Practice of Pharmacy," 20<sup>th</sup> ed., Lippincott Williams & Wilkins, Baltimore, Maryland (2000), incorporated herein by reference.

[0111] Pharmaceutical compositions containing the compounds of the invention may be in any form suitable for the intended method of administration, including, for example, a solution, a suspension, or an emulsion. Liquid carriers are typically used in preparing solutions, suspensions, and emulsions. Liquid carriers contemplated for use in the practice of the present invention include, for example, water, saline, pharmaceutically acceptable organic solvent(s), pharmaceutically acceptable oils or fats, and the like, as well as mixtures of two or more thereof. The liquid carrier may contain other suitable pharmaceutically acceptable additives such as solubilizers, emulsifiers, nutrients, buffers, preservatives, suspending agents, thickening agents, viscosity regulators, stabilizers, and the like. Suitable organic solvents include, for example, monohydric alcohols, such as ethanol, and polyhydric alcohols, such as glycols. Suitable oils include, for example, soybean oil, coconut oil, olive oil,

safflower oil, cottonseed oil, and the like. For parenteral administration, the carrier can also be an oily ester such as ethyl oleate, isopropyl myristate, and the like.

Compositions of the present invention may also be in the form of microparticles, microcapsules, liposomal encapsulates, and the like, as well as combinations of any two or more thereof.

[0112] Other additives include immunostimulatory agents known in the art. Immunostimulatory oligonucleotides and polynucleotides are described in PCT WO 98/55495 and PCT WO 98/16247. U.S. Patent Application No. 2002/0164341 describes adjuvants including an unmethylated CpG dinucleotide (CpG ODN) and a non-nucleic acid adjuvant. U.S. Patent Application No. 2002/0197269 describes compositions comprising an antigen, an antigenic CpG-ODN and a polycationic polymer. Other immunostimulatory additives described in the art may be used, for example, as described in U.S. Patent No. 5,026,546; U.S. Patent No. 4,806,352; and U.S. Patent No. 5,026,543.

[0113] A controlled release delivery system may be used, such as a diffusion controlled matrix system or an erodible system, as described for example in: Lee, "Diffusion-Controlled Matrix Systems", pp. 155-198 and Ron and Langer, "Erodible Systems", pp. 199-224, in "Treatise on Controlled Drug Delivery", A. Kydonieus Ed., Marcel Dekker, Inc., New York 1992. The matrix may be, for example, a biodegradable material that can degrade spontaneously *in situ* and *in vivo* for, example, by hydrolysis or enzymatic cleavage, *e.g.*, by proteases. The delivery system may be, for example, a naturally occurring or synthetic polymer or copolymer, for example in the form of a hydrogel. Exemplary polymers with cleavable linkages include polyesters, polyorthoesters, polyanhydrides, polysaccharides, poly(phosphoesters), polyamides, polyurethanes, poly(imidocarbonates) and poly(phosphazenes).

[0114] The compounds of the invention may be administered enterally, orally, parenterally, sublingually, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers, adjuvants, and vehicles as desired. For example, suitable modes of administration include oral, subcutaneous, transdermal, transmucosal, iontophoretic, intravenous, intramuscular, intraperitoneal, intranasal, subdermal, rectal, and the like. Topical administration may also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. The term parenteral includes

subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion techniques.

[0115] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-propanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

[0116] Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable nonirritating excipient such as cocoa butter and polyethylene glycols that are solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

[0117] Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

[0118] Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, cyclodextrins, and sweetening, flavoring, and perfuming agents.

[0119] As to the mode of administration, it should be emphasized that it is the combination of therapeutic agents that gives rise to its synergistic therapeutic effect no matter whether the first and the second agent are administered together or separately. Therefore, the two agents may be given together in a single dose or in separate ones with respect to space and time.

[0120] Effective amounts of the compounds of the invention generally include any amount sufficient to detectably treat viral infections.

[0121] Successful treatment of a subject in accordance with the invention may result in the inducement of a reduction or alleviation of symptoms in a subject afflicted with a medical or biological disorder to, for example, halt the further progression of the disorder, or the prevention of the disorder.

[0122] The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination, and the severity of the particular disease undergoing therapy. The therapeutically effective amount for a given situation can be readily determined by routine experimentation and is within the skill and judgment of the ordinary clinician.

[0123] The compounds of the present invention can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multilamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients, and the like. The preferred lipids are the phospholipids and phosphatidyl cholines (lecithins), both natural and synthetic. Methods to form liposomes are known in the art. See, for example, Prescott, Ed., *Methods in Cell Biology*, Volume XIV, Academic Press, New York, N.W., p. 33 *et seq* (1976).

[0124] While the compounds of the invention can be administered as the sole active pharmaceutical agent, they can also be used in combination with one or more other agents used in the treatment of disorders. Representative agents useful in combination with the compounds of the invention for the treatment of viral infections include, for example, Interferon, Ribavirin, gancyclovir and the like.

[0125] When additional active agents are used in combination with the compounds of the present invention, the additional active agents may generally be

employed in therapeutic amounts as indicated in the PHYSICIANS' DESK REFERENCE (PDR) 53<sup>rd</sup> Edition (1999), that is incorporated herein by reference, or such therapeutically useful amounts as would be known to one of ordinary skill in the art.

[0126] The compounds of the invention and the other therapeutically active agents can be administered at the recommended maximum clinical dosage or at lower doses. Dosage levels of the active compounds in the compositions of the invention may be varied so as to obtain a desired therapeutic response depending on the route of administration, severity of the disease and the response of the patient. The combination can be administered as separate compositions or as a single dosage form containing both agents. When administered as a combination, the therapeutic agents can be formulated as separate compositions that are given at the same time or different times, or the therapeutic agents can be given as a single composition.

[0127] Compounds of the present invention can be readily synthesized using the methods described herein, or other methods, that are well known in the art.

[0128] The compounds can be used in the form of salts derived from inorganic or organic acids. ## EXAMPLES

### BENZAZOLE COMPOUNDS

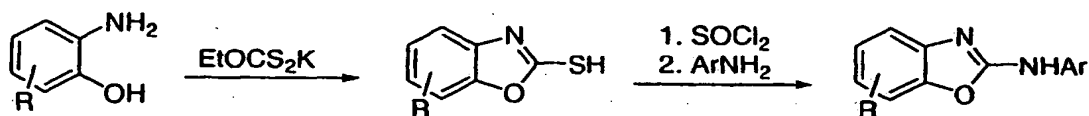

#### Scheme 1

**[0133]** Compounds of the invention containing a benzimidazole core may be prepared using a number of methods familiar to one of skill in the art. In one method, suitably functionalized diamines may be coupled with various thioisocyanates to form the intermediate thioureas. Cyclization to form the benzimidazole moiety may be effected under known conditions such as with treatment carbodiimides or alkyl halides. Alternatively the diamines may be reacted sequentially with carbonyl diimidazole and phosphoryl chloride followed by coupling with the appropriate amine.

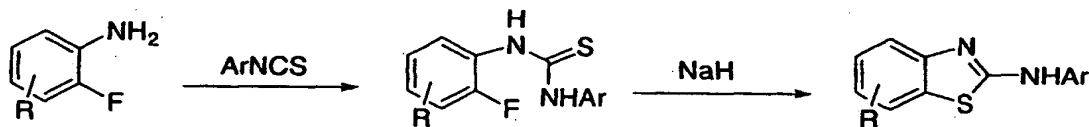

[0134] Compounds containing the oxazole structure may similarly be prepared according to the methods above or according to other known general procedures.

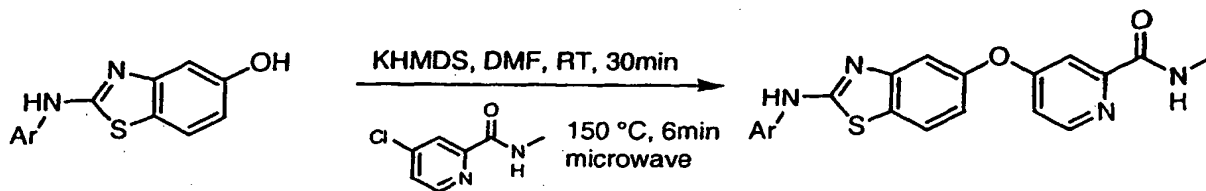

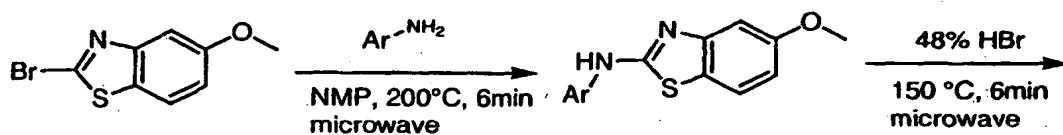

Haviv et. al. (J. Med. Chem. 1988, 31, 1719) describes a procedure for assembling oxazole cores wherein a hydroxy aniline is treated with ethyl potassium xanthate. The resulting sulfonyl benzoxazole may then be chlorinated and coupled with an amine.

[0135] Compounds containing a benzothiazole core may also be prepared according to known methods. An ortho-halothioisocyanate may be reacted with an amine to form a thiourea. Reduction with NaH then allows formation of the thiazole ring.

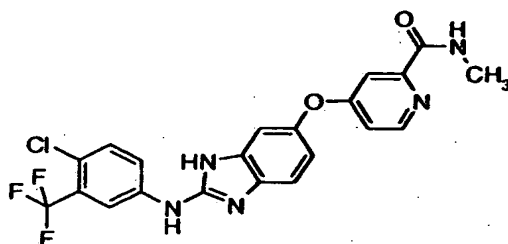

[0136] Benzothiazoles may generally be substituted in accordance with the present invention, such as through the following synthetic pathway:

## Example 1

Synthesis of 4-[(2-[[4-chloro-3-(trifluoromethyl)phenyl]amino]-1H-benzimidazol-6-yl)oxy]-N-methylpyridine-2-carboxamide

[0137] The compound 4-[(2-[[4-chloro-3-(trifluoromethyl)phenyl]amino]-1H-benzimidazol-6-yl)oxy]-N-methylpyridine-2-carboxamide (159322) was synthesized as follows:

[0138] Step 1. Synthesis of 4-[(4-amino-3-nitrophenyl)oxy]-N-methylpyridine-2-carboxamide: A mixture containing 4-amino-3-nitrophenol (1eq) and potassium bis(trimethylsilyl)amide (2eq) was stirred in dimethylformamide for 2 hours at room temperature. To this mixture was added (4-chloro(2-pyridyl))-N-methylcarboxamide (1eq) and potassium carbonate (1.2eq) and stirred at 90°C for 3 days. The reaction mixture was then concentrated and partitioned between ethyl acetate and water. The organic layer was separated and washed with brine, dried, filtered, and concentrated in vacuum to give brown solid. Purification on silica gel (2% triethyl amine / 50% ethyl acetate in hexane) gave 4-[(4-amino-3-nitrophenyl)oxy]-N-methylpyridine-2-carboxamide as an orange solid. The product gave satisfactory NMR. HPLC, 3.39min; MS:  $MH^+ = 289$ .

[0139] Step 2. Synthesis of 4-[(3,4-diaminophenyl)oxy]-N-methylpyridine-2-carboxamide: The mixture containing [4-(3-amino-4-nitrophenoxy)(2-pyridyl)]-N- in methanol with catalytic amount of 10%Pd/C was hydrogenated until disappearance of the yellow color to yield the product amine. HPLC, 2.5mins; MS:  $MH^+ = 259$ .

[0140] Step 3. Synthesis of 4-[(2-[[4-chloro-3-(trifluoromethyl)phenyl]amino]-1H-benzimidazol-6-yl)oxy]-N-methylpyridine-2-carboxamide:

The mixture containing 4-[(3,4-diaminophenyl)oxy]-N-methylpyridine-2-carboxamide (1eq) and 4-chloro-3-(trifluoromethyl)benzeneisothiocyanate (1eq) in tetrahydrofuran was stirred at room temperature for 16 hours to give the corresponding thiourea. To the resulting mixture was added 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (2eq) and the mixture was stirred

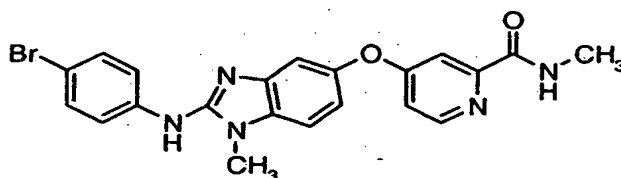

for another 10 hours. The mixture was concentrated and partitioned between ethyl acetate and water. The organic layer was washed with brine and dried. Purification on HPLC gave 4-[(2-([4-chloro-3-(trifluoromethyl)phenyl]amino)-1H-benzimidazol-6-yl)oxy]-N-methylpyridine-2-carboxamide. MS:  $MH^+ = 462$

### Example 2

Synthesis of 4-((2-[(4-bromophenyl)amino]-1-methyl-

1H-benzimidazol-5-yl}oxy)-N-methylpyridine-2-carboxamide

[0141] The compound 4-((2-[(4-bromophenyl)amino]-1-methyl-1H-benzimidazol-5-yl}oxy)-N-methylpyridine-2-carboxamide (161651) was synthesized as follows:

[0142] Step 1. Synthesis of 4-[[3-amino-4-(methylamino)phenyl]oxy]-N-methylpyridine-2-carboxamide: A solution of 4-[(4-amino-3-nitrophenyl)oxy]-N-methylpyridine-2-carboxamide (1eq) in methylene chloride was treated with trifluoroacetic anhydride (1eq) and stirred for 10 minutes at 0 °C. The mixture was quenched with satd.  $NaHCO_3$  solution. The organic layer was separated and washed with water, brine, dried and evaporated. MS:  $MH^+ = 385.2$

[0143] To a solution of the trifluoroacetamide (1eq) in a mixture of toluene, acetonitrile and sodium hydroxide solution (50%) was added benzyltrimethylammonium chloride (1eq) and dimethyl sulfate (1.2eq). The biphasic mixture was stirred overnight at room temperature and evaporated. The mixture was taken up in ethyl acetate, washed with water, brine, dried and evaporated. The crude product was purified by column chromatography eluting with 1:1 hexanes and ethyl acetate followed by 2% triethylamine in 1:1 hexanes and ethyl acetate followed by 2% triethylamine in 1:1 hexanes and ethyl acetate to afford N-methyl-4-[[4-(methylamino)-3-nitrophenyl]oxy]pyridine-2-carboxamide as a reddish orange solid. MS:  $MH^+ = 303.1$ .

[0144] The solution of nitromethylaniline in methanol was treated with 5% palladium on carbon and stirred under hydrogen atmosphere for 15 min. (until the disappearance of yellow coloration) at room temperature. The mixture was filtered

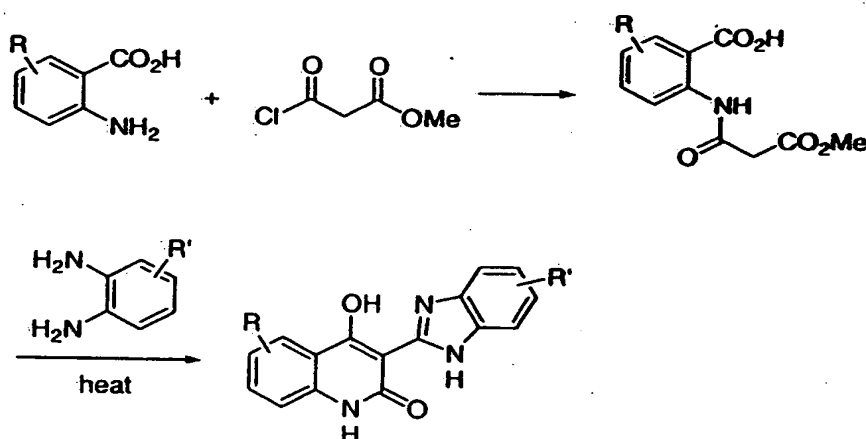

and the filtrate was concentrated to provide 0.36 g of the diamine 4-([3-amino-4-(methylamino)phenyl]oxy)-*N*-methylpyridine-2-carboxamide. MS:  $MH^+ = 273.3$ .

[0145] Step 2. Synthesis of 4-([2-([4-bromophenyl]amino)-1-methyl-1*H*-benzimidazol-5-yl]oxy)-*N*-methylpyridine-2-carboxamide: A solution of the diamine 4-([3-amino-4-(methylamino)phenyl]oxy)-*N*-methylpyridine-2-carboxamide (1eq) in methanol was treated with 4-bromophenylisothiocyanate (1eq) and stirred at 60 °C - 65°C for 2 hours. The reaction mixture was cooled down to room temperature and methyl iodide (1eq) was added and stirred overnight at 60°C. The reaction was cooled to room temperature, evaporated, taken up in ethyl acetate, and washed with water and brine, dried, and evaporated under reduced pressure. Column chromatography using a gradient solvent system of hexanes and ethyl acetate and either 1:1 methylene chloride and acetone or 5% methanol in methylene chloride yielded the product as a half white powder. MS:  $MH^+ = 452.3$

#### AMINO BENZIMIDAZOLYLQUINOLINONES

[0146] Compounds of structure I may be synthesized from simple starting molecules as shown in Schemes 1-4 and exemplified in the Examples. As shown in Scheme 1, compounds of structure I may generally be prepared using aromatic compounds substituted with amines and carboxylic acid groups.

Scheme 2.

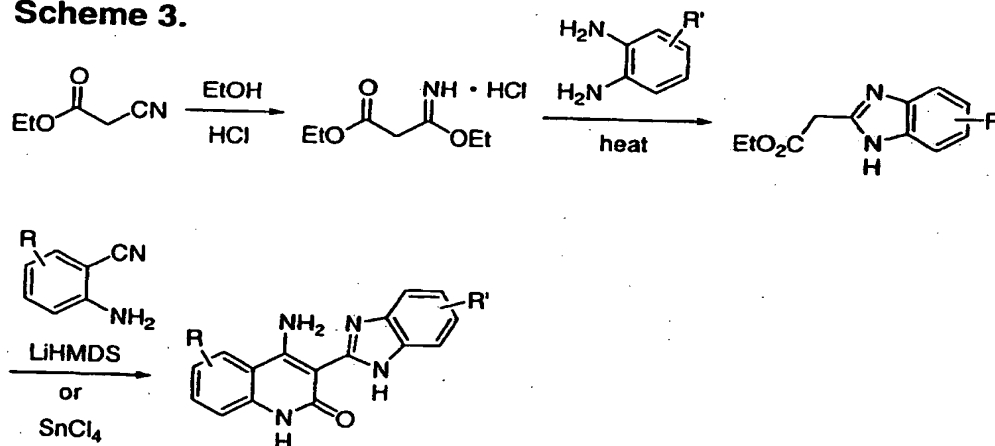

[0147] As shown in Scheme 2, a substituted aromatic compound such as a substituted or unsubstituted 2-aminobenzoic acid may be reacted with an acyl halide such as methyl 2-(chlorocarbonyl)acetate to produce an amide that will react with a substituted or unsubstituted 1,2-diaminobenzene. The resulting product is a 4-

hydroxy-substituted compound of structure I. One skilled in the art will recognize that the procedure set forth in Scheme 1 may be modified to produce various compounds.

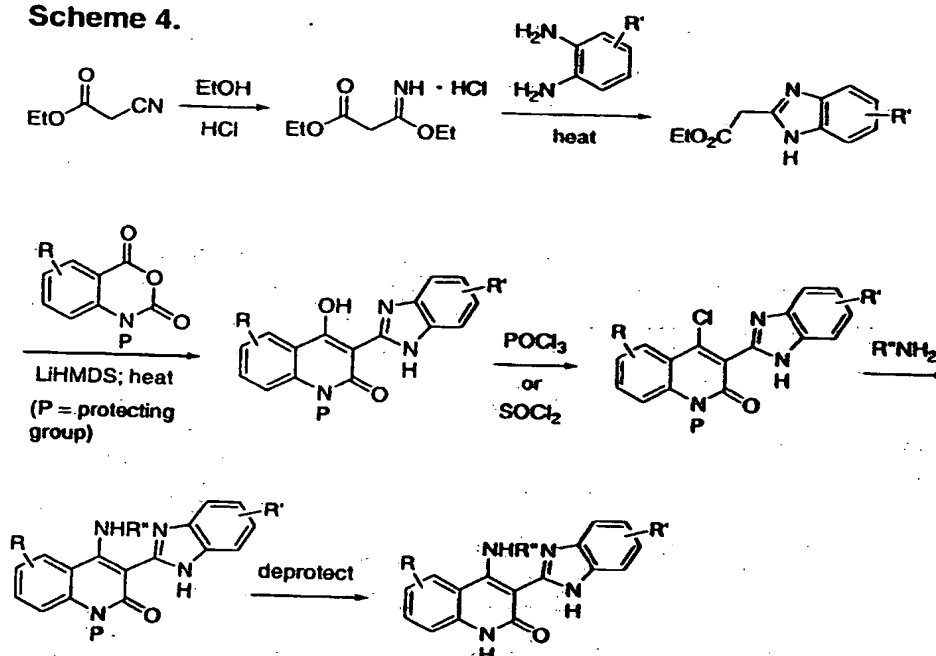

[0148] A method for preparing 4-amino substituted compounds of structure I is shown in Scheme 3. As shown in Scheme 3, aromatic compounds substituted with amine and nitrile groups may be used to synthesize 4-amino substituted compounds of structure I. A compound such as ethyl 2-cyanoacetate may be reacted with ethanol to produce ethyl 3-ethoxy-3-iminopropanoate hydrochloride. Subsequent reaction with a substituted or unsubstituted 1,2-phenylenediamine provides substituted or unsubstituted ethyl 2-benzimidazol-2-ylacetate. Reaction of a substituted or unsubstituted ethyl 2-benzimidazol-2-ylacetate with an aromatic compound having an amine and nitrile group such as substituted or unsubstituted 2-aminobenzonitrile with a base such as lithium bis(trimethylsilyl)amide or a Lewis acid such as tin tetrachloride provides the substituted or unsubstituted 4-amino substituted compound of structure I.

**Scheme 3.**

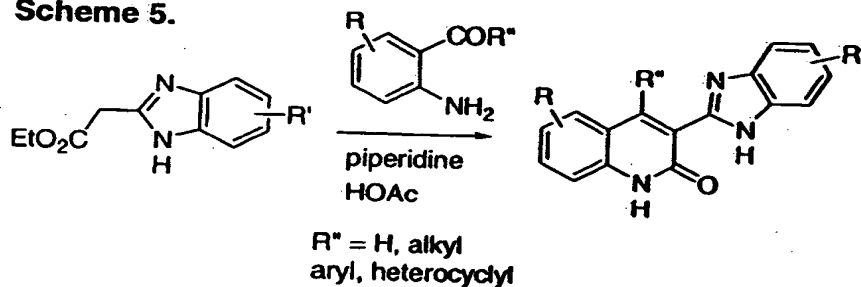

[0149] Scheme 4 illustrates a general synthetic route that allows for the synthesis of 4-dialkylamino and 4-alkylamino compounds of structure I. An inspection of Scheme 3 shows that 4-hydroxy substituted compounds of structure I may be converted into the 4-chloro derivative by reaction with phosphorous oxychloride or thionyl chloride. The 4-chloro derivative may then be reacted with an alkylamine or dialkylamine to produce the corresponding 4-alkylamino or 4-dialkylamino derivative. Deprotection affords the final 4-alkylamino or 4-dialkylamino compounds of structure I. Other groups that may be reacted with the 4-chloro derivative in this manner include, but are not limited to, ROH, RSH, and CuCN.

Scheme 4.

[0150] As shown in Scheme 5, the synthesis of compounds of structure I having a H, alkyl group, aryl group, or heterocyclyl group in the 4-position may be accomplished using a substituted or unsubstituted 2-benzimidazol-2-ylacetate prepared as shown in Schemes 3 and 4.

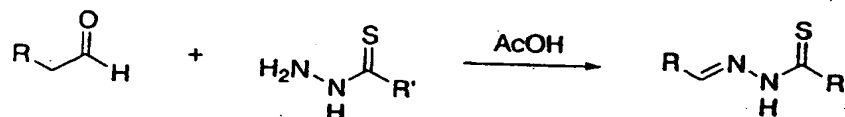

Scheme 5.

Preparation of amino(3-[5-(3-chlorophenyl)(2-furyl)](2-pyrazoliny))methane-1-thione

[0164] To a solution of 5-(3-chlorophenyl)furan-2-carbaldehyde (1.0 equiv.) in THF at 0 °C was added MeMgBr in ether (3.0 equiv.) and stirred for 45 min. The reaction was quenched with water, diluted with ether and filtered through Celite. The organic layer was separated and washed with brine, dried over MgSO<sub>4</sub>, and concentrated to give the 1-[5-(3-chlorophenyl)-2-furyl]ethan-1-ol.

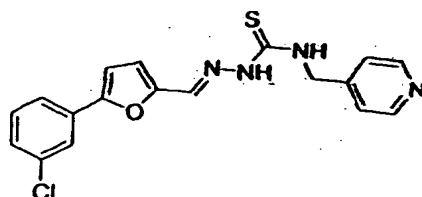

[0165] To a solution of secondary alcohol(1.0 equiv.) in CH<sub>2</sub>Cl<sub>2</sub> was added MnO<sub>2</sub> (10 equiv.). The reaction was stirred overnight, filtered through Celite, and concentrated to give 1-[5-(3-chlorophenyl)-2-furyl]ethan-1-one.

[0166] To a mixture of ketone (1.0 equiv.), paraformaldehyde (2.0 equiv.), and dimethylamine hydrochloride (2.0equiv) and molecular sieves in ethanol was added concentrated hydrochloric acid (cat.). The reaction was refluxed overnight under nitrogen and the concentrated. A few drops of HCl was added, and the mixture was worked up with DCM and water. The organic layer was discarded. The aqueous

layer was adjusted to basic and extracted with DCM (3x). The organic layer was washed with brine, dried over  $\text{MgSO}_4$ , and concentrated to yield 3-(dimethylamino)-1-[5-(3-chlorophenyl)(2-furyl)]propan-1-one.

[0167] Thiosemicarbazide (1.0 equiv.) was dissolved in MeOH upon heating under nitrogen. Aqueous sodium hydroxide (6 M, 9.0 equiv.) was added to the reaction. A methanol solution of 3-(dimethylamino)-1-[5-(3-chlorophenyl)(2-furyl)]propan-1-one (1.0 equiv) was then added dropwise to the reaction mixture. The solvent was removed and the residue was dissolved in DCM and washed with water, brine, dried over  $\text{MgSO}_4$ , and concentrated. The final compound was purified by preparative-HPLC to give amino[3-[5-(3-chlorophenyl)(2-furyl)](2-pyrazolynyl)]methane-1-thione; LC/MS  $m/z$  306.2 ( $\text{MH}^+$ );  $R_t \approx 3.06$  minutes.

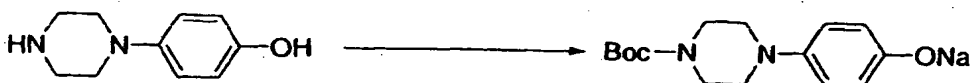

Scheme 14

[0168] To a solution of 4-pyridylmethylamine (1.0 equiv.) and triethylamine (2.0 equiv.) in  $\text{CHCl}_3$  was added  $\text{CS}_2$  (1.0 equiv.) and stirred overnight. The reaction was cooled to  $0^\circ\text{C}$  and ethyl chloroformate (1.0 equiv.) was added dropwise. The reaction was stirred for 15 min at  $0^\circ\text{C}$  and then stirred at room temperature for 2 hrs followed by addition of (tert-butyl)oxycarbonylhydrazide (1.2 equiv.). After stirring for an additional hour the mixture was washed with aqueous citric acid (5%), saturated  $\text{NaHCO}_3$ , brine, dried over  $\text{MgSO}_4$ , and concentrated. The desired Boc protected thiosemicarbazide was purified using column chromatography.

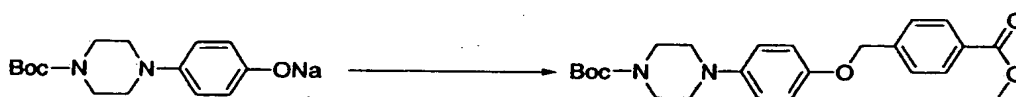

[0169] To a solution of Boc protected thiosemicarbazide (1.0 equiv.) dissolved in DCM was added HCl in dioxane (2M, 8.3 equiv.) and stirred for 15 min. MeOH is then added to dissolve the precipitate, followed by addition of the furfural, and small amount of acetic acid (0.5 mL). The mixture is stirred overnight and the solvents are removed to give a residue purified by preparative-HPLC to give the thiosemicarbazone.

[0170] Synthesis of 4-[4-(4-methylpiperazin-1-yl)phenoxy]methyl]benzaldehyde

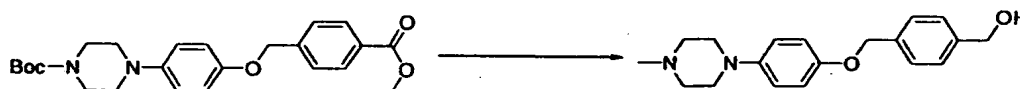

**[0171]** To a solution of 4-piperazin-1-yl phenol (1 equivalent) in  $\text{CHCl}_3$ , cooled to  $0^\circ\text{C}$ , was added di-*t*-butyl dicarbonate (1 equivalent) in  $\text{CHCl}_3$  drop-wise. The solution was stirred at  $0^\circ\text{C}$  for 1 hour before removing from the cold bath and stirring at ambient temperatures for 18 hours. The organic solution was washed aqueous  $\text{NaHCO}_3$  and brine dried over  $\text{MgSO}_4$  and concentrated the crude material was used without purification.

**[0172]** A solution of the resulting 4-(1-BOC-piperazin-4-yl)phenol (1 equivalent) in dry  $\text{CH}_3\text{CN}$  was slowly added drop-wise to a slurry of  $\text{NaH}$  (1 equivalent) in dry  $\text{CH}_3\text{CN}$  at room temperature under  $\text{N}_2$ . The slurry was stirred at room temperature for 2 hours before the solids were filtered and washed with  $\text{Et}_2\text{O}$ .

**[0173]** Sodium 4-(1-BOC-piperazin-4-yl)phenoxide (1 equivalent) and methyl 4-bromomethylbenzoate (1 equivalent) were combined in dry acetone and heated to reflux at  $60^\circ\text{C}$  for 18 hours. The slurry was filtered and the filtrate was then concentrated to provide the crude methyl 4-[4-(1-BOC-piperazin-4-yl)phenoxymethyl]benzoate, that was used without purification.

**[0174]** To a slurry of  $\text{LiAlH}_4$  (4 equivalents) in dry THF, cooled to  $0^\circ\text{C}$  under  $\text{N}_2$ , was slowly added drop-wise a solution of methyl 4-[4-(1-BOC-piperazin-4-yl)phenoxymethyl]benzoate (1 equivalent) in dry THF. Once the addition was complete, the slurry was heated to reflux at  $80^\circ\text{C}$  for 1 hour. The slurry was subsequently cooled to  $0^\circ\text{C}$  and treated with water, 10% aq.  $\text{NaOH}$  and with water again. The resulting solids were filtered, and the filtrate was diluted with chloroform, washed with brine, dried over  $\text{MgSO}_4$  and concentrated, providing the crude 4-[4-(4-methylpiperazin-1-yl)phenoxymethyl]benzyl alcohol that was used without purification.

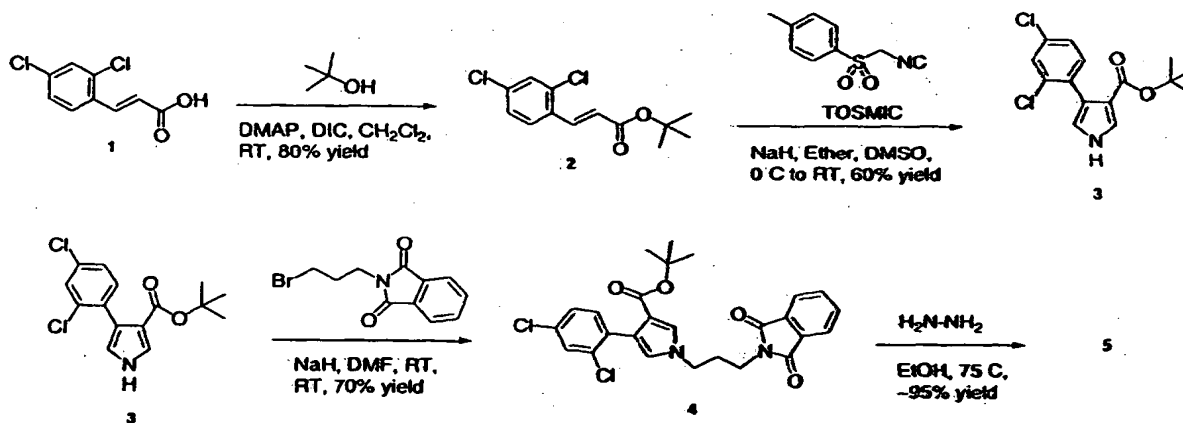

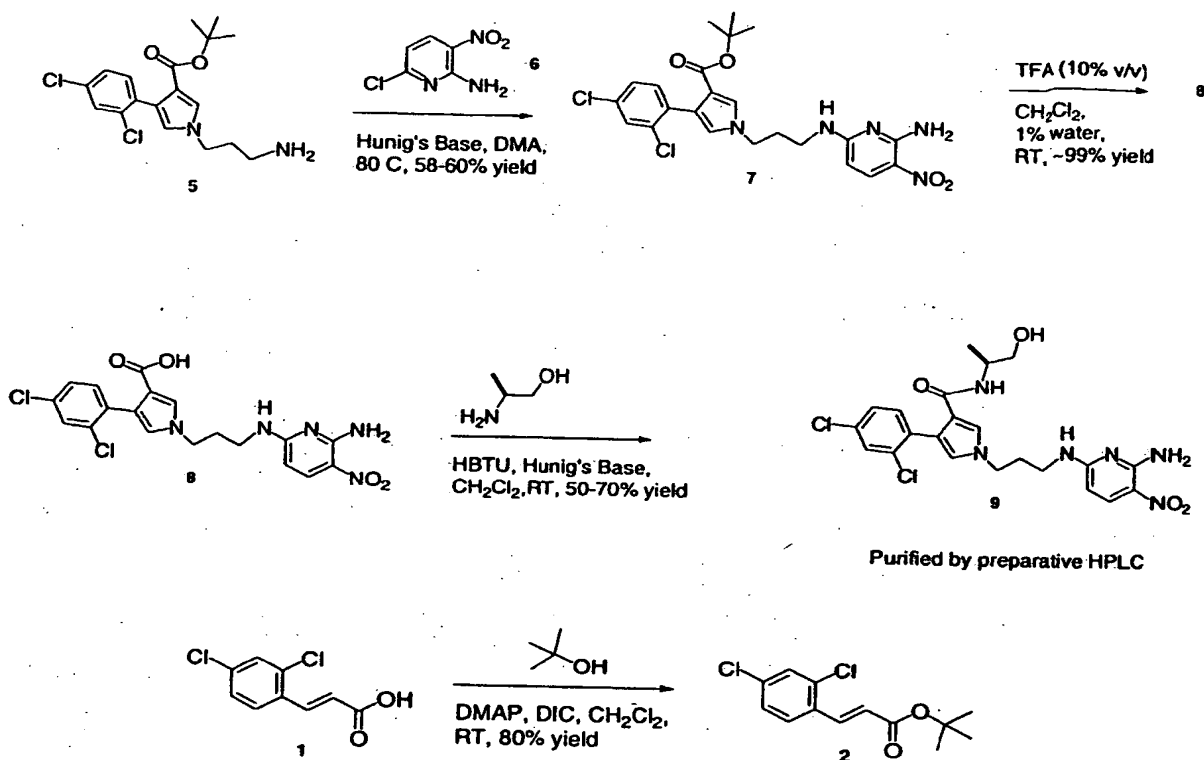

[0175] To a solution of DMSO (2.6 equivalents) in dry DCM, cooled to  $-78^{\circ}\text{C}$  under  $\text{N}_2$  was added oxalyl chloride (1.1 equivalents) in DCM drop-wise. The solution was stirred at  $-78^{\circ}\text{C}$  for 5 minutes before a solution of 4-[4-(4-methylpiperazin-1-yl)phenoxy]methyl]benzyl alcohol (1 equivalent) in DCM was added drop-wise, and allowed to stir at  $-78^{\circ}\text{C}$  for another 30 minutes. Triethylamine (2.5 equivalents) was slowly dripped in before allowing the solution to reach ambient temperatures. The solution was washed with aqueous  $\text{NaHCO}_3$  and brine, dried over  $\text{MgSO}_4$  and concentrated to provide the crude 4-[4-(4-methylpiperazin-1-yl)phenoxy]methyl]benzaldehyde that was converted to thiosemicarbazones according to Scheme 7.

## PYRROLES

### Scheme 15

#### Synthesis of Pyrrole

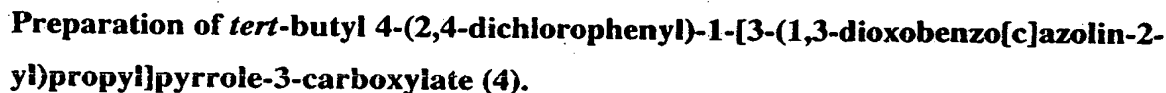

**Preparation of *tert*-butyl (2E)-3-(2,4-dichlorophenyl)prop-2-enoate (2).**

[00216] Neat DIC (1.4 eq) was added to a well stirred solution of cinnamate (1 eq), *t*-butyl alcohol (4 eq), DMAP (1.4 eq) and CH<sub>2</sub>Cl<sub>2</sub> under argon at rt. (Note - The cinnamate must be completely in solution which may require gentle warming. Allow the solution to cool to room temperature before adding the DIC. To avoid an exotherm on larger scales, it may be prudent to dilute the DIC with CH<sub>2</sub>Cl<sub>2</sub> before the addition and have an ice bath ready.) After stirring for 8 hours, the reaction develops a white precipitate. The reaction may be monitored by TLC eluting with 25% EtOAc/Hexane (*R<sub>f</sub>* of product was 0.9). The entire reaction was loaded into a separatory funnel (washing with CH<sub>2</sub>Cl<sub>2</sub>). The organic mixture was washed with citrate, sat. aq. NaHCO<sub>3</sub>, water, and brine. The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to dryness to give the crude product as an oil. The crude oil was mixed with hexane and stirred for 30 min. The precipitate that forms was filtered over celite and the filtrate was evaporated. The hexane mixture was loaded onto a filter plug of silica and eluted with EtOAc/hexane (97:2 v/v). The first eluted UV active fractions are collected and evaporated to give >99% pure 2 (75-80% yields).

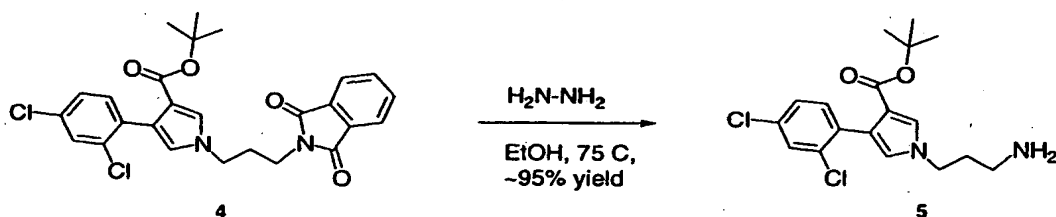

After decanting off the ether via syringe, the NaH was suspended again with fresh ether under argon. A solution of TOSMIC (1.1 eq) and **2** (1 eq) dissolved in a mixture of ether and DMSO was added dropwise to the stirred suspension of NaH at 0 °C over 20-30 min. The addition was mildly exothermic and evolved gas.

After the addition, the reaction was allowed to warm to ambient rt. The progress of the reaction was followed by TLC (25% EtOAc/Hexane, the UV active product was at  $R_f = 0.4$ ) and LCMS until done (~2-3 h). Upon completion, the reaction was carefully quenched with sat. aq.  $\text{NH}_4\text{Cl}$  (added slowly to avoid strong gas evolution and exotherm) and diluted with ether. The layers were separated and the organic phase was washed with sat. aq.  $\text{NaHCO}_3$ , water, and brine. The crude dark solid can be purified by recrystallization. Best results were achieved either through recrystallization directly from a mixture of hot EtOAc/hexane (1:3 v/v) or by dissolving the crude product in minimal hot EtOAc followed by addition of hexane (~2 volumes of hexane based on the volume of EtOAc). The hot solutions were allowed to cool to room temperature and age over night. The crystals were first filtered and then washed with hexane giving 99% pure product in 60-70 % yield.

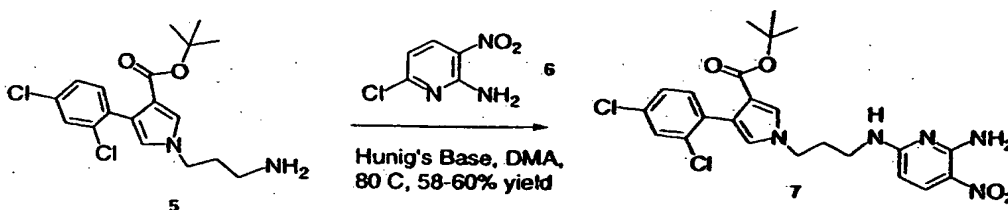

[00218] Solid NaH (1.5 eq as the oil dispersion) was added in small portions to a solution of pyrrole 3 (1 eq) and 3-bromopropyl phthalimide (1.2 eq) dissolved in DMF stirred at room temperature and flushed with argon. NOTE - Some gas evolves, but the temperature does not seem to rise above 40-50 °C. The reaction was stirred for 1.5 h at room temperature under argon. The reaction was followed by TLC (CH<sub>2</sub>Cl<sub>2</sub>/acetonitrile (95:5 v/v), the UV active product was at R<sub>f</sub> = 0.5) and LCMS. Upon completion, the reaction was quenched with sat. aq. NH<sub>4</sub>Cl (add slowly to avoid strong gas evolution and exotherm). Sat. aq. NaHCO<sub>3</sub> was then added to avoid an emulsion, and the basic organic mixture was extracted with ether. The combined ether layers were washed with sat. aq. NaHCO<sub>3</sub>, water, brine, dried Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated to dryness to give the crude product. The crude product was purified by eluting through silica with EtOAc/Hexane (1:4 v/v). The purified product contained some residual 3-bromopropyl phthalimide, that did not interfere with subsequent synthetic steps. The material was taken on and used without further purification. Assume a quantitative yield.

**Preparation of *tert*-butyl 1-(3-aminopropyl)-4-(2,4-dichlorophenyl)pyrrole-3-carboxylate (5).**

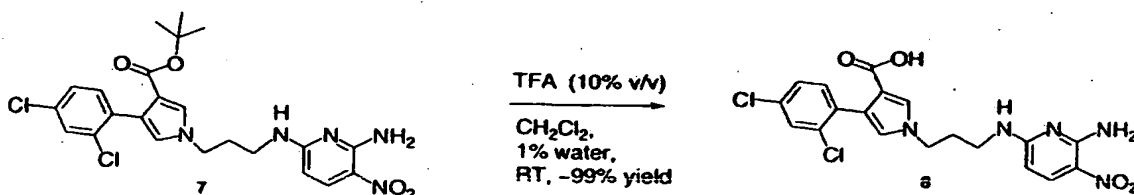

[00219] The Phthalimido Pyrrole 4 (1 eq) was dissolved in ethanol and hydrazine (3 eq) at room temperature under nitrogen. Upon heating to reflux, the reaction generated a white precipitate. Stir at reflux until complete (~2 h) by TLC (CH<sub>2</sub>Cl<sub>2</sub>/acetonitrile (95:5 v/v), the UV active product was at R<sub>f</sub> = 0.2) and LCMS. Upon reaching completion, the reaction was allowed to cool to room temperature and the precipitate was vacuum-filtered off using a medium to fine cintered-glass filter. The filtrate was concentrated under reduced pressure to a gummy solid. The crude material was taken up in ethanol/EtOAc (1:1 v/v), stirred and the precipitate was filtered off in the same fashion as before. The filtrate was concentrated under reduced pressure and then dried *in vacuo* for 10-15 min. This

process of adding ethanol/EtOAc, filtering and concentrating was done one more time or as needed to remove the majority of the white precipitate and residual hydrazine. The product was then dried *in vacuo* overnight. The material was used without further purification. Once dried, the reaction yielded the product as a glass (~87% yield over 2 steps).

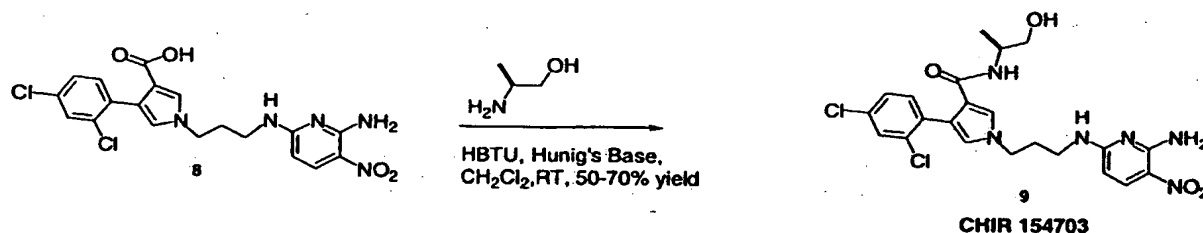

**Preparation of *tert*-butyl 1-(3-[(6-amino-5-nitro(2-pyridyl))amino]propyl)-4-(2,4-dichlorophenyl)pyrrole-3-carboxylate (7).**

[00220] To the premixed dry reagents, pyrrole 5 (1 eq) and powdered 6-chloro-3-nitro-2-pyridylamine (6) (1.1 eq), was added the DMA followed by Hünig's base (2 eq) sequentially with stirring at rt. The reaction was then heated to 80 °C overnight. The reaction was followed by TLC (EtOAc/hexane (1:1 v/v), the UV active yellow product was at  $R_f = 0.25$ ), HPLC and LCMS. Upon completion as judged by HPLC, the reaction was allowed to cool to 70 °C. Ethylene diamine (anhydrous) was then added to the reaction to destroy any remaining unreacted chloropyridine 6. After 15 min stirring at 70 °C, the reaction was cooled and quenched with the addition of sat. aq.  $\text{NaHCO}_3$ . The aqueous mixture was extracted with EtOAc, and the combined organic layers were washed with sat. aq.  $\text{NaHCO}_3$ , water, brine, dried, filtered, and concentrated to dryness to give the crude product as a brown-yellow solid. The crude product was purified by flash chromatography eluted with EtOAc/hexane (4:6 v/v). The purified SnAr adduct 7 was isolated in 58% yield as a yellow solid.

**Preparation of 1-{3-[(6-amino-5-nitro(2-pyridyl))amino]propyl}-4-(2,4-dichlorophenyl)pyrrole-3-carboxylic acid (8).**

[00221] In a vial, TFA (catalytic amount) was added to a stirred mixture of *tert*-butyl ester pyrrole 7 (1 eq), water (.1%), and CH<sub>2</sub>Cl<sub>2</sub> at rt. The vial stirred at room temperature until done (~12 h. The reaction was then concentrated under reduced pressure at room temperature and dried *in vacuo*. The crude residue was dissolved again in CH<sub>2</sub>Cl<sub>2</sub> and concentrated under reduced pressure at rt. The material was used in the final coupling step without further purification as the TFA salt.

**Preparation of N-((1S)-2-hydroxy-isopropyl)-1-{3-[(6-amino-5-nitro(2-pyridyl))amino]propyl}-4-(2,4-dichlorophenyl)pyrrol-3-ylcarboxamide (9).**

[00222] (2S)-(+)-2-Aminopropan-1-ol (1.5 eq) was added to a stirred mixture of acid (8) (1 eq), HBTU (1.5 eq), Hünig's base (2 eq) and DMF (premixed sequentially in this order in a vial) at room temperature under argon. The reaction was stirred for 3-4 h until complete as shown by LCMS and HPLC. The reaction mixture was subsequently diluted with EtOAc, washed with NaHCO<sub>3</sub>, and concentrated to afford a powder in a 70% yield.

## BIOLOGICAL METHODS

### Method 1

- [00225] Candidate small molecule immuno-potentiators can be identified *in vitro*. Compounds are screened *in vitro* for their ability to activate immune cells. One marker of such activation is the induction of cytokine production, for example TNF- $\alpha$  production. Apoptosis inducing small molecules may be identified having this activity. These small molecule immuno-potentiators have potential utility as adjuvants and immuno-therapeutics.
- [00226] In an assay procedure (High Throughput Screening (HTS)) for small molecule immune potentiators (SMIPs), human peripheral blood mononuclear cells (PBMC), 500,000 per mL in RPMI 1640 medium with 10% FCS, were distributed in 96 well plates (100,000 per well) already containing 5  $\mu$ M of compound in DMSO. The PBMCs were incubated for 18 h at 37°C in 5% CO<sub>2</sub>. Their ability to produce cytokines in response to the small molecule compounds is determined using a modified sandwich ELISA.
- [00227] Briefly supernatants from the PBMC cultures were assayed for secreted TNF using a primary plate bound antibody for capture followed by a secondary biotinylated anti-TNF antibody forming a sandwich. The biotinylated second antibody was then detected using streptavidin-Europium and the amount of bound europium was determined by time resolved fluorescence. SMIP compounds were confirmed by their TNF inducing activity that was measured in the assay as increased Europim counts over cells incubated in RPMI medium alone. "Hits" were selected based on their TNF-inducing activity relative to an optimal dose of lipopolysaccharide LPS (1  $\mu$ g/ml), a strong TNF inducer. The robustness of the assay and low backgrounds allowed for the routine selection of hits with ~10% of

LPS activity that was normally between 5-10X background (cells alone). Selected hits are then subjected to confirmation for their ability to induce cytokines from multiple donors at decreasing concentrations. Those compounds with consistent activity at or below 5  $\mu$ M are considered confirmed for the purposes of this assay. The assay is readily modified for screening for compounds effective at higher or lower concentrations.

## Method 2

**[00228]** Each of Examples 2-67 elicited TNF- $\alpha$  production in human peripheral blood mononuclear cells. Many of the compounds showed activity at less than 20  $\mu$ M with respect to production of TNF- $\alpha$ . Many of these compounds showed activity at less than 5  $\mu$ M with respect to production of TNF- $\alpha$ . Many of these compounds showed activity in the production of TNF- $\alpha$  at less than 1.5  $\mu$ M.

**[00229]** For this reason, each of the R groups of any of the compounds listed in Table 1 are preferred. Additionally, because of the excellent activity of each of the compounds, each of these compounds is individually preferred and is preferred as a member of a group that includes any or all of the other compounds and each compound is preferred in methods of modulating immunopotentiality and in methods of treating biological conditions associated therewith, for example to be used as a vaccine adjuvant. Each of the compounds is also preferred for use in preparation of medicaments for vaccines, immunopotentiality, reducing tumor growth and in treating biological conditions mediated therefrom.

**[00230]** In addition to the procedure described above, methods of measuring other cytokines (e.g. IL-1-beta, IL-12, IL-6, IFN-gamma, IL-10 etc.) are well known in the art and can be used to find active SMIP compounds of the present invention.

**[00231]** Compounds may be useful that cause production of TNF- $\alpha$  at higher concentrations, such as 100  $\mu$ M, 200  $\mu$ M or 300  $\mu$ M in the assays described herein. For example Loxoribine causes useful production of TNF- $\alpha$  at 300  $\mu$ M (see Pope et al Immunostimulatory Compound 7-Allyl-8-Oxoguanosine (Loxoribine) Induces a Distinct Subset of Murine Cytokines Cellular Immunology 162: 333-339 (1995)).

**[00232]** While the invention has been described with respect to specific examples including presently preferred modes of carrying out the invention, those skilled in

the art will appreciate that there are numerous variations and permutations of the above described systems and techniques that fall within the spirit and scope of the invention.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2004/010331

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 25-29 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☒ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:  
1-5, 23-29, 33 (partially) 6, 11, 21, 30
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☒ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/SA/ 210

## Continuation of Box II.1

Although claims 25-29 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

## Continuation of Box II.2

Present claims 25,26 relate to a method/use defined by reference to the following parameters:  
stimulating an immune response

The use of these parameters in the present context is considered to lead to a lack of clarity within the meaning of Article 6 PCT. It is impossible to compare the parameters the applicant has chosen to employ with what is set out in the prior art. The lack of clarity is such as to render a meaningful complete search impossible. Consequently, the search has been restricted to the parts relating to the diseases specified in 200-201 of the application.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.
